

Build your own can guitar

You need: One piece of wood, one can, string (guitar or piano string, we used guitar strings), one screw nut to attach in the bottom of the can and one screw loop to attach the string with at the other end.

1. Take a stick and make it long enough for a guitar, and then take a can.

2. Make a hole in the bottom of the can close to the edge.

3. Hit a needle close to the end of the can, but don't hit it to the bottom.

4. Wind tape around the can and the stick.

5. Hit the nail to the bottom so it fixes the can.

6. Attach the string to the screw nut.

7. Pull the string through the bottom hole and through the can.

8. Make a small hole and screw the screw loop til it's stuck, but not to the bottom. Attach the string to the screw loop and then you can tune the string the way you like.

The guitar is ready for playing!
