

Biodynamical agriculture

centar

dr. Rudolfa Steinerja

Rudolf Steiner work in every day
life of one farm worker

Lecturer: Amalka Vukelić, dipl.ing.agr.

Rudolf Steiner biography

- Born in Donji Kraljevec, 27. February 1861., Austro-Hungarian empire
- At very early age he was recognized as an visionary with different point of view on world around us
- He was doctor of mathematical studies and philosophy, with paralel studying in literature, education and medical sciences

- He founded anthroposophy, eurhythmy, Waldorf pedagogy, organic architecture, anthroposophical medicine and biodynamical agriculture
- His work was based on knowledge and awareness of world around us and natural forces that move world, universe and whole being.
- Majority of Steiner's work in philosophy was based on Goethe and his work, so Steiner in 1913, in Dornach (Switzerland), builds Goetheanum, which is still a Center of all Steiner's work

ro

Agricultural course – 1924.

- 8 lectures held by dr. R. Steiner in Koberwitz 07.-16. June 1924, and lecture in Dornach on 20. June 1924.
- Foundation of biodynamical agriculture that gave directions on „How to grow” in sustainable way

Handbook – Agricultural course

English version
from 1958

Croatian version

Biodynamical agriculture

- Biodynamical agriculture is founded on principles of one farm one organism - self sustainable
- **Few of the ground rules in biodynamic:**
 - ❖ Compost is the base of the production
 - ❖ Usage of the biodynamical preparations
 - ❖ Animals in the farm are fed by biodynamical principles
 - ❖ No usage of any sort of medications in farm

Biodynamical agriculture

- The use of organic fertilizers;
- Spray preparations numbers 500 and 501;
- The transition on the biodynamic method of husbandry and the influence of the rotation of crops;
- Consideration of other factors of environment.

The preparation of manure

- The most effective manure is a mixture in which cow dung dominates, horse dung is next in quantity, and there is a small percentage only of pig and sheep dung.
- Where such a mixture is not available it may still be applied, but it would be preferable to turn the manure into compost

Making a compost pile

- In order to preserve energy and highly valid humus, compost piles are must have in the farm
- Composting is the easiest way to import humus and increase fertility in soil
- Whatever is capable of decay or decomposition can be turned into compost
- The only exceptions to be made are human excrement, coal ashes and newspaper – because print contains chemical ingredients that are inimical to the bacterial life of the soil

nero

Finished compost pile in autumn

Covered compost pile that is ready for winter and maturation of compost

Making a compost pile

- A trench or ditch should be dug out evenly to a spade's depth.
- The bottom should be covered with straw or with a thin layer of prepared manure or compost
- The most practical shape for the compost-heap is long and rectangular, 3,5-4,5 m wide at the base, 1,5-2,5 m wide at the top, and 1,5-2 m feet high
- There is no limit as to the length. If the heaps are smaller, the proportions of width at base and top, and of height should be in the same ratio.

Making a compost pile

- Cross section trough pile

Making a compost pile

- But smaller heaps can be made. The heap should be built up generously to allow for shrinkage
- Ingredients:
 - ❖ Vegetable refuse, leaves, and weeds should be placed upon it in layers.
 - ❖ Coarse pieces and small twigs should first be broken into smaller bits
 - ❖ Mature manure between layers to speed up process of decomposting

Making a compost pile

- A layer of vegetable refuse about 25-30 cm deep, then a sprinkling of quicklime, then a layer of 5-10 cm of earth, then again a layer of vegetable matter, and so on, until a height of from four to 1,8 m is reached, when the heap should be covered with earth.
- Thinner layers – 10 cm of organic matter and 5 cm of soil – give the quickest decomposition – 3-4 months.
- Lawn cuttings should never be more than 5-10 cm thick.
- The earth dug out from the trench can be used both for the layers of earth and for the covering.
- The heap may be built up by degrees

nero

Finished compost heap

Cross section trough compost heap, ready for maturing and proceses of decomposting.

Adding the preparations

- The preparations should then be inserted – one portion of one preparation in each hole.
- A portion is $\frac{1}{2}$ to 1 gram.
- The preparations 502-507 should be used in rotation, one portion in each hole, the series beginning again when six holes have been filled.

Placing the preparations in the heap

einero

Yarrow – Achillea millefolium (No.502)

- Stolisnik (CRO)
- Planet Venus, arranges processes of Potassium and Nitrogen in soil

Chamomile – Matricaria recutita (No.503)

- Kamilica (CRO)
- Planet Mercury, arranges processes of Nitrogen in soil

Stinging Nettle – Urtica dioica (No.504)

- Kopriva (CRO)
- Planet Sun, arranges processes of Iron in soil

Oak bark – *Quercus robur* (No.505)

- Kora hrasta (CRO)
- Planet Mars, arranges processes of over growth

Dandelion – Taraxicum officianale (No.506)

- Maslačak (CRO)
- Planet Jupiter, arranges ratio of Silicium acid and Potassium in soil

Valerian – *Valeriana officianalis* (No.507)

- Odoljen (CRO)
- Planet Saturn, arranges process of Phosphorus in soil

Temperature of composting

Phase	Characteristic Processes	Important Organisms	Result	Duration
Initial	degradation	bacteria	-	few hours to a few days
Thermophilic	degradation	bacteria, fungi	ammonia	1 to 3 weeks
Cooling	conversion	bacteria, fungi	nitrates	4-6 weeks to 3 months
Maturing	synthesis	fungi animals	humus-like substances and humus	several months

- The different phases of aerobic composting as reflected by temperature; source: table: GRAY & BIDDLESTONE, 1981 (modified)

ero

Turning the heap

- A compost pile should never be turned during the hot phase.
- If a pile is turned the practice should be carried out during the cooling phase to limit ammonia loss.
- The advantages of turning are not clear cut and it is important to balance the pros and cons before turning.

Turning the heap

- **Advantages:**

- ❖ Remixing the compost mechanically can prevent the likely compaction and consequent seepage due to the ongoing sagging process of the heap.
- ❖ Turning will move material from the colder outside edges of the pile to its centre where the higher temperature may reduce the content of viable pathogens and weed seeds.

- **Disadvantages:**

- ❖ Turning intensively aerates the material, resulting in an almost complete loss of ammonia.
- ❖ Turning a heap results in the material being chopped up. This may lead to a higher density after turning.
- ❖ Turning results in added costs for labour and machinery.

Losing the compost nutrients

- During the composting process nutrients can be lost as gaseous emissions and in the effluent as soluble compounds.
- The main nutrient to be lost is nitrogen, which can be emitted in gaseous form as ammonia (NH_3), nitrous oxide (N_2O) elementary nitrogen (N_2) and nitrogen oxides (NO_x), and leached out as nitrate (NO_3^-), ammonium (NH_4^+) or as a soluble organic N compound.
- Other gaseous emissions are methane (CH_4) and carbon dioxide (CO_2), which are relevant as greenhouse gases, and hydrogen sulphide (H_2S); while potassium and phosphate can be lost by seepage into the ground.

Losing the compost nutrients

- Levels of nutrient loss during aerobic composting. In Forschungsring e.V. open air composting trials, which were conducted over an 11 year period, average rates of loss were:
 - Nitrogen: 33%.
 - Potassium: 17-39%.
 - Phosphate: almost zero
- Seepage occurs when the compost pile contains more water than the material can hold in its pores. Other than a high water content there are three possible causes for seepage:
 - ❖ Rain or thaw water that soaks into an uncovered pile.
 - ❖ Respiration water released during the aerobic decomposition of organic substances.
 - ❖ Expressed water that results from the compression of the material during the sagging process.

Seeding calendar

Steinero

- According to the work of Maria and Matthias Thun calendar is primarily based on the sidereal lunar cycle.
- The impulse determined by the predominating element each day is the most decisive factor.
- She advises following these positions systematically, whether it be for sowing, applying the biodynamic preparations, transplanting, hoeing or harvesting, always bearing in mind the organ of the plant that one wishes to develop.

Plants of the root

- All plants that we grow for root

Leaf plants

- All plants that we grow for leaf

Flower plants

- All plants that we grow for flower

Fruit plants

- All plants that we grow for fruit

Seeding calendar

Companion planting

COMPANION PLANTING

IN NATURAL ECOSYSTEMS, PLANTS PERFORM FUNCTIONS THAT CAN EITHER HELP OR PREVENT OTHER PLANTS TO GROW. THE SAME IS TRUE IN OUR GARDENS. THIS CHART WILL HELP YOU UNDERSTAND WHICH PLANTS GROW WELL TOGETHER AND WHICH TO PLANT FAR APART!

PLANT	GOOD COMPANIONS	BAD COMPANIONS
BEANS	MAIZE, SUNFLOWERS, LAVENDER, CABBAGE, CUCUMBER, STRAWBERRIES, BEINZAL	ONION, GARLIC, FENNEL
BEEETROOT	BEANS, ONIONS, GARLIC, LETTUCE, CABBAGE	NO BAD COMPANIONS
BEINZAL	CALENDULA, MARIGOLDS, MINT, PEAS	NO BAD COMPANIONS
BROCCOLI, CABBAGE, CAULIFLOWER, KALE	AROMATIC PLANTS, DILL, SAGE, ROSEMARY, POTATOES, BEETROOT, CELERY, GARLIC, ONIONS, GERANIUM	TOMATOES, POLE & RUNNER BEANS, PEPPERS
CARROTS	LETTUCE, CHIVES, LEEKS, ROSEMARY, SAGE, PEAS, WORMWOOD	STRAWBERRIES, FENNEL, CABBAGE
LETTUCE	CARROTS, RADISH, STRAWBERRIES, CUCUMBER, BEANS	CELERY, PARSLEY
MAIZE	SUNFLOWERS, AMARANTH, BEANS, PEAS & OTHER LEGUMES, PUMPKIN, SQUASH, CUCUMBER, MELONS & OTHER CUCURBITS, PARSLEY	CABBAGE, TOMATO, CELERY
ONION/GARLIC	CARROTS, BEETROOT, STRAWBERRIES, TOMATOES, LETTUCE, CABBAGE	PEAS, BEANS, PARSLEY, LEEKS
BEAS	LAVENDER, CARROT, TURNER, RADISH, CUCUMBER, MAIZE, BEANS, & GROWS WELL WITH MOST VEGETABLES & HERBS	ONION, GARLIC
PEPPERS	TOMATOES, GERANIUM, BASIL, CARROT, ONION	BEANS, KALE, CABBAGE FAMILY
POTATOES	CORIANDER, MARIGOLD, BEANS, MAIZE, CABBAGE FAMILY, BEINZAL	PUMPKIN, CUCUMBER, SQUASH, MELONS, SUNFLOWERS, TOMATOES
SPINACH	STRAWBERRIES, BROAD BEANS, PEAS	NO BAD COMPANIONS
TOMATOES	BASIL, OREGANO, PARSLEY, CHIVES, NASTURTIUM, ONIONS, CARROTS, CELERY, CALENDULA, GERANIUM, BOBAGE	POTATOES, FENNEL, CABBAGE FAMILY
CALENDULA	TOMATOES - REPELS TOMATO WORM!	GENERAL PEST DETERRANT, PLANT THROUGHOUT GARDEN
COMPREY	FAST-GROWING NUTRIENT ACCUMULATOR, PLANT ALONG EDGES & USE LEAVES FOR MULCH	COMPOST ACTIVATOR, USE LEAVES TO MAKE COMPREY TEA FERTILIZER!
CHILE PEPPER	CABBAGE, MAIZE	REPELS CABBAGE MOTH, PLANT ON BORDERS TO KEEP FLYING PESTS AWAY!
MARIGOLD	PLANT FREELY THROUGHOUT THE GARDEN - REPELS SOIL NEMATODES, APHIDS, BEAN BEETLES & MANY MORE	USE MARIGOLD LEAVES TO MAKE AN ORGANIC GENERAL INSECTICIDE SPRAY!
NASTURTIUM	TOMATOES - IMPROVES FLAVOR	REPELS WHITE FLIES & SPIDER MITES
THYME	CABBAGE	DETERS CABBAGE WORM
ROSEMARY	CARROTS, CABBAGE, SAGE, BEANS	DETERS CABBAGE MOTH, BEAN BEETLES & CARROT FLY!
WORMWOOD/ARTEMESIA	AROUND GARDEN EDGES	KEEPS ANIMALS OUT! ALSO REPELS WHITE FLY
YARROW	PLANT FREELY THROUGHOUT THE GARDEN, REPELS SOIL NEMATODES, APHIDS, BEAN BEETLES, AND MANY MORE!	PLANT NEAR AROMATIC HERBS TO ENHANCE ESSENTIAL OIL PRODUCTION

A DIVERSE GARDEN IS AN ABUNDANT GARDEN. HAPPY PLANTING!
