

Protect our forests^{by 2A}

FOREST PROTECTION MEASUREMENTS

Forests are the lungs of our planet. They are extremely important, we need trees to breathe, therefore no forests would mean a lack of tress and this would mean a lack of oxygen!

Forests are being destroyed, for instance when we use lots of paper and furniture. They also have other economical importance as tourism, this makes money too. Moreover, they are the natural habitat for lots of animal, they are their home! Would you like someone to come into your house and not look after it?

This article is going to look into and cover the various different aspects as to why we should preserve forests.

POLLUTION

Trees are important for a lot of reasons, but the most important is that they transform the CO₂ in O₂ when they produce photosynthesis.

So, the more trees we have, the less pollution the air is. It also will prevent some natural disasters as global warming.

Nations should develop more strict environmental laws, but we can contribute using and promoting recycled articles.

FIRE PREVENTION

Fire in our forests are a global problem caused by natural elements and most of them by human beings.

One way to prevent fire would be not throwing away cigarettes or glass. We also should remember that it could be very dangerous if the fire extends to a city.

RUBBISH

When some people go to the forest or other natural places they usually throw rubbish (plastics, food, containers...) to the floor.

To prevent this, more bins could be installed but if we go far away we should pick up our litter and even that one that we have found in our way.

The forest should stay cleaner than when we arrived!
