

Robolution

This story takes place in the year of 2050, in a very modern and technological city, in which cars used to fly and citizens used to communicate by means of holograms. A great and brilliant inventor called Albert Tecnoy used to live in this city. His assistants and he were working in the lab on a secret project related to Robotics. They were supposed to create a fish they had heard about in a very old story. It was a robotized fish that used to help people. When they finished it they did some tests to see if it was working properly. After the test had been a success they decided to baptize him with the name Fishobot and decided to create more different versions, so that soon they could be shown and sold to the world. However, what happened was that one of the tests destroyed the memory chip of the Fishobot prototype and, as soon as it was turned on to be shown to the public, it started to have free will and to destroy everything.

Afterwards, Fishobot activated and controlled the other robots, this way starting a robotic revolution that lead to the disappearance of humanity and the robots dominated the world. The creator was the only one who survived the attack and, in his lab, he tried to figure out a way to deactivate them. But, he didn't manage it and he ended up being killed by his own creations.
