

Solar Power

1. It is a clean way for energy production, because it will not pollute the earth.
2. Solar panels could prevent climate changes.
3. Solar panels are infinite energy source unlike coal, natural gas and oil.
4. Solar power is cheaper than oil, natural gas and coal. The production costs of solar panels have dropped by 99% since 1977.
5. The Harvard School has estimated, that burning coal in the U.S. costs 500 billion dollars in environmental and health damage.
6. If people keep burning fossil fuels, pollution may cause:
 - acid rain
 - coal dust from mining which causes a lot of illnesses
 - coal combustion waste is the second largest contributor to landfills after solid waste
 -
1. Solar panels are easy to manufacture and install, unlike fossil fuels which cost more than solar panels.
2. It cuts down the electricity bill, because electricity from the sun is free and you only need to pay for installing the solar panels.
3. Installing solar panels will improve the economy, because the solar industry is growing and will boost the economy. For example in 2018 over 10000 people were working in solar industry in Australia.
4. Low/ no maintenance is needed for solar panels. Once they are installed, they can run without any maintenance for 30 to 35 years.
5. Solar panels do not require a lot of materials to be built, unlike oil rigs and power plants.
