<h3>EXPERIMENT: BIOLOGY – circulation of the blood and the optical nerve</h3>		

RESEARCH QUESTION

Why do astronauts often see flashes of light during their time in space?

HYPOTHESIS (Indicate the correct answer.)

In space, because of the lack of gravity, there's a fluid shift in the body. The blood and the other fluids in the body are spread *less/more* equally. On earth, thanks to gravity, there's *less/more* blood in our legs.

Because in space there's *less/more* blood in the head, there's a pressure on the optical nerve. This causes impulses that go straight to the brain.

OPERATION OF THE EXPERIMENT

Measure the periphery of your neck and ankles while you are standing up straight.

Do the same while you are lying down.

If possible you can measure the periphery while standing upside down on your hands. Be careful☺

THE RESULTS / OBSERVATIONS

	Standing up	Lying down	Upside down (if possible)
Periphery neck (cm)			
Periphery ankles (cm)			

CONCLUSION

Watch the following clips:

<https://www.youtube.com/watch?v=MTgLO0D9Gew>

<https://www.youtube.com/watch?v=Lur4W5ZSqj8>

Combine this information with the results of the experiment.
