

Entre Rhodes et Kos, il y a une île "oubliée" du Dodécanèse, qui a été créée par l'activité volcanique. La superficie totale de l'île est de 41 km². et ses habitants à peine plus de 1000. À **Nisyros**, le sentiment de "nature sauvage" est intense, mais il offre des images uniques de paysages lunaires et atteint chaque année ceux qui veulent voir de près les cratères du volcan silencieux mais actif en train de déborder.

Aussi paysages lunaire on trouve à l'île de **Milos**

Milos

Milos

An aerial photograph of terraced agricultural fields in Nisyros, Greece. The terraces are arranged in a grid-like pattern across a hillside. The colors of the terraces vary significantly, including shades of blue, purple, red, brown, and green, likely due to different soil types or crops. A central valley or stream bed is visible, cutting through the terraces. The overall scene is a vibrant display of human-made agricultural structures in a natural landscape.

NISYROS

NISYROS

An aerial photograph of the Nisyros volcano in Greece. The image shows a large, rugged mountain with a prominent crater in the center. The terrain is characterized by steep, rocky slopes and a complex network of ridges and valleys. The colors range from dark brown and black on the upper slopes to lighter tan and yellowish-brown in the lower areas, possibly due to volcanic ash or mineral deposits. The sky is clear and blue. The word "NISYROS" is overlaid in white text on the left side of the image.
