# NASA Explorer Schools Pre-Algebra Unit <br> Lesson 1 Student Workbook 

## Solar System Math Comparing Size and Distance

What are the parts of the solar system and how do they compare?

Name: $\qquad$ Date: $\qquad$

## Pre-Lesson Activity

Step 1: On the back of this paper draw a picture of our solar system. In your drawing, show the different sizes of the planets and where they are located. Label everything. If you have time, add color to your picture.

Step 2: Using the chart below, list what you know about our solar system in the column titled "What I know." In the column titled "What I want to know" write questions you have about our solar system and space exploration.
$\qquad$ Date: $\qquad$

## Math Review: Converting Units

| Length | Volume | Mass |
| :--- | :--- | :--- |
| 1 kilometer $=1,000$ meters | 1 gallon $\approx 3.78$ liters | 1 pound $\approx 454$ grams |
| 1 meter $=100$ centimeters | 1 gallon $=4$ quarts | 1 kilogram $=1,000$ grams |
| 1 centimeter $=10$ millimeters | 1 quart $\approx 0.95$ liter | 1 gram $=100$ centigrams |
| 1 mile $=5,280$ feet | 1 liter $=1,000$ milliliters | 1 centigram $=10$ milligrams |
| 1 yard $=3$ feet | 1 pint $=0.5$ quart |  |
| 1 meter $\approx 3.28$ feet | 1 pint $=16$ fluid ounces |  |
| 1 foot $=12$ inches |  |  |
| 1 inch $\approx 2.54$ centimeters |  |  |

Directions: Use the table of relationships above to solve practice problems 1-5 below. You may use additional paper for doing calculations.

1. Yna bought 3 gallons of milk at the store.

How many liters did she buy? $\qquad$ liters
2. Jamal caught a pass and ran 57 yards to make a touchdown.

How many feet did he run? $\qquad$ feet
3. A car weighs 850 pounds. How much does it weigh in kilograms? (Hint: change pounds to grams, then change grams to kilograms) $\qquad$ kilograms
4. Jessica runs the 100-meter dash at the track meet.

How many feet does she run? $\qquad$ feet
5. Bonus: Juan and his family traveled 339 miles from San Jose to Los Angeles. How many kilometers did they travel? $\qquad$ kilometers

Name: $\qquad$ Date: $\qquad$

## Travel Planning

1. If you planned a family vacation, $\underline{\text { how }}$ would you decide where to go?
2. What factors (details about your trip) would you need to think about?
a. $\qquad$ c. $\qquad$
b. $\qquad$ d. $\qquad$

## Space Exploration

3. What are some reasons for humans to explore our solar system?

$\qquad$
4. Why should humans explore space in addition to robots?

Name: $\qquad$ Date: $\qquad$

## A Brief History of Units of Measurement Student Reading

To measure a distance between two objects you need two things: a unit of measurement (how much you are measuring by) and a tool (what you measure with). Long before measuring tools like rulers and tape measures were common, people needed a way to measure things. In early times, people who did not have tools used parts of their bodies (like their thumbs) to measure.

About 950 years ago, the width of a person's thumb was considered an inch. In many languages, the word for thumb and inch are the same or very close. A person's foot was used to measure feet. A yard was the length from the tip of the king's nose to the end of his fingertips.

Everyone had a way to measure distances, but there was a problem. Everyone knew what to measure with, but there was no standard for how big things were. For example, if you measured the length of your bedroom with your feet, and then your friend did the same with his feet, you would not get the exact same measurement because your feet and your friend's feet are different sizes.

Eventually people agreed on standards-measurements that were the same for everyone. The Romans liked to divide things into units of 12. This is why we have 12 months in the year. They decided that a foot contained 12 inches. In England in the 1100's, King Henry I decided to use the Roman standard of measurement for feet, and he spread the word to his people that a foot was 12 inches long. Once the standards were set and everyone agreed on the lengths of units of measurement, the system worked better. But it still is not perfect.

In the 1800's, the French Academy of Sciences was asked to develop a system of measurement that was based on scientific measurements and used the base-10 system. The Academy set their standard of
measurement (a meter) as a fraction of the distance from the North Pole to the equator on the surface of the Earth. Larger and smaller units were made by multiplying or dividing a meter by factors of 10 . One thousand meters is a kilometer. One hundred centimeters is a meter. Ten millimeters is a centimeter. Even the names of the units indicate how big they are: kilo- means 1000, centi- means 100. Now we can just move the decimal point to
 change from larger or smaller units.

By the year 1900, thirty-five countries decided that the metric system would be their standard system of measurement. Some countries, like the USA, did not decide that the metric system would be their standard system of measurement. This can be a challenge when international scientists and engineers try to work together on the same project!

While kilometers are useful for measuring distances on Earth, they are too small for measuring distances throughout the solar system. For
 example, the distance from the Sun to Jupiter is $778,000,000 \mathrm{~km}$ ( 778 million kilometers). Scientists decided to create a new unit of measurement, which would be helpful when measuring the solar system. They called the average distance between the center of the Earth and the center of the Sun one Astronomical Unit (1 AU). This distance is $150,000,000 \mathrm{~km}$, which is roughly the number of kilometers between the center of the Earth and the center of the Sun. The rest of the solar system ranges between 0.4 AU (from Mercury to the Sun) to 39.3 AU (from Pluto to the Sun).

When leaving the solar system and looking at other star systems, the AU is too small for scientists' needs. So they created a LARGER unit of measurement. Scientists measure a light-year as the distance light can travel in one year. The next closest star to Earth (after the Sun) is Alpha Centauri, which is 4.34 light-years away. This means that the light we see from Alpha Centauri at night actually left the star 4.34 years ago.

Our system of measurement has evolved from using thumbs and feet to using the distance traveled by light in one year. As our scope of the universe continues to expand, so will our need for new standards of measurement.

## Discussion Questions

1. What is the problem with using parts of the body as a unit of measurement?
$\qquad$
2. Why were customary (or standard) units established?
3. What is the advantage of metric units?
4. Why is using kilometers to measure distances in our solar system a problem?
5. What standard unit in astronomy was developed to measure large distances?

Name: $\qquad$ Date: $\qquad$

## Unit Conversion: Building the Concept

1. Looking at the picture of the ruler marked with inches and centimeters, we see that there are approximately 2.54 centimeters in 1 inch. Write this in the spaces below.
$1 \mathrm{inch} \approx$ $\qquad$ .___ centimeters

2. Now that you know there are approximately 2.54 centimeters in one inch, use this information to solve the problems below. There are many ways to find the answers. For example, you may use a ruler, or draw a picture, or add, multiply, or divide. Show your work, and then discuss your method (or strategy) with the class.

| Solve | Show your method (strategy). |
| :---: | :---: |
| 5 inches $\approx \ldots$ centimeters |  |
| 10 inches $\approx \ldots$ centimeters |  |
|  |  |
|  |  |

Name: $\qquad$ Date: $\qquad$

## Unit Conversion: Applying the Concept

1. "A Brief History of Units of Measurement" talked about the average distance between the center of the Sun and the center of the Earth.

Name this unit of measurement: $\qquad$ Draw a picture...
2. How many kilometers are in 1 AU? $\qquad$
3. Jupiter is $778,000,000$ kilometers from the Sun. How many $A U$ is Jupiter from the Sun? Show your work so you can discuss your strategy with the class.

Show your work here...
$\qquad$ Date: $\qquad$

## Unit Conversion: Using Unit Ratios Sample Problem

This sample problem will help you learn to use "unit ratios" to convert from one unit to another unit.

| What we know: | What we want to know: |
| :---: | :---: |
| $1 \mathrm{AU}=150,000,000 \mathrm{~km}$. | How many AU is Jupiter from <br> the Sun? |
| Jupiter is $778,000,000 \mathrm{~km}$ from <br> the Sun. |  |

If we want to know how many AU Jupiter is from the Sun, then we need to convert $778,000,000 \mathrm{~km}$ to AU. We can do this using a unit ratio.

To convert km to AU , use the unit ratio:
1 AU
$150,000,000 \mathrm{~km}$

This unit ratio is equal to ___ because 1 AU is equal to 150 million km .

When you multiply a distance by this unit ratio, you are multiplying the distance by $\qquad$ . You are not changing the value of the distance. The distance is the same. You simply changed the unit used to measure it.

First, set up the problem.

$$
778,000,000 \mathrm{~km}=778,000,000 \mathrm{~km} \cdot \frac{1 \mathrm{AU}}{150,000,000 \mathrm{~km}}
$$

Second, cancel the kilometers by marking through the km.

$$
=778,000,000 \mathrm{~km} \cdot \frac{1 \mathrm{AU}}{150,000,000 \mathrm{~km}}
$$

Third, multiply $778,000,000$ by 1 AU.

$$
=\frac{\mathrm{AU}}{150,000,000}
$$

Fourth, cancel the zeros by marking through them.

$$
=\frac{778,000,000 \mathrm{AU}}{150,000,000}
$$

Fifth, divide the numerator (top number) by the denominator (bottom number).

$$
=\frac{778 \mathrm{AU}}{150}
$$

Sixth, round to the nearest tenth and state your answer.

Name: Date:

1a) When measuring really large distances, such as the distance from Mars to the Sun, what unit(s) would be most appropriate to use?
$\square$ astronomical units kilometers/miles meters/feet

1b) Why is meters or centimeters a poor choice? $\qquad$
$\qquad$
2) In the "Using Unit Ratios" Sample Problem on pages 13-14, you divided 778 by 150 . Using a calculator, the answer is 5.1866667. How precise does this measurement need to be when calculating the scale model distance to Jupiter?
$\square 5.1866667$ AU
$\square 5.187$ AU
$\square 5.2 \mathrm{AU}$

3a) Do the calculations below. (Remember 1.0 AU $=150,000,000 \mathrm{~km}$.
0.1 $\mathrm{AU} \approx$ $\qquad$ km
or $\qquad$ million km
0.01 AU $\approx$ $\qquad$ km
or $\qquad$ million km
0.001 AU $\approx$ $\qquad$ km
or $\qquad$ thousand km

3b) To what place value (tenths, hundredths, or thousandths) is it reasonable to round AU for your scale model calculations? Why?

## Creating a Clay Model of the Solar System

MATERIALS: 9 index cards, marker, 3 pounds of clay (or dough)

DIRECTIONS: Using a marker, label the 9 index cards with the names of the 9 planets. Then using 3 pounds of modeling clay, follow the 7 steps listed below.
Step 1. Divide the clay into $\mathbf{1 0}$ equal parts (tenths).

- Use 6 tenths to make Jupiter.
- Use 3 tenths to make Saturn.
- Use the remaining clay (1 tenth) in step 2.

Step 2. Divide the remaining clay into tenths.

- Add 5 tenths to Saturn.
- Use 2 tenths to make Neptune.
- Use 2 tenths to make Uranus.
- Use the remaining clay (1 tenth) in step 3.

Step 3. Divide the remaining clay into fourths.

- Add 3 fourths to Saturn.
- Use the remaining clay ( 1 fourth) in step 4.

Step 4. Divide the remaining clay into tenths.

- Use 2 tenths to make Earth.
- Use 2 tenths to make Venus.
- Add 4 tenths to Uranus.
- Combine the remaining clay (2 tenths) and use in step 5 .
Step 5. Divide the remaining clay into tenths.
- Use 1 tenth to make Mars.
- Add 4 tenths to Neptune.
- Add 4 tenths to Uranus.
- Use the remaining clay (1 tenth) in step 6.

Step 6. Divide the remaining clay into tenths.

- Add 2 tenths to Uranus.
- Use the remaining clay (1 tenth) in step 7.

Step 7. Divide the remaining clay into tenths.

- Add 9 tenths to Uranus.
- Use 1 tenth to make Pluto.
$\qquad$ Date: $\qquad$

## Calculating Scale of the Clay Model, Part I

## Purpose

Now that you have created a scale model of the solar system in terms of size, you need to establish a scale for your model in terms of distance. Then you will need to calculate the distance from the Sun for each planet in your model.

Finding the scale between the model of the solar system and the actual solar system is the mathematical challenge of this activity. For a model, the "scale" is the amount by which the size of the original has been changed proportionally. The key to finding the scale distances is using ratios and proportions-relationships between the model distances and the actual distances.

## Let's Begin!

In your clay model, Pluto is the furthest object from the Sun. For the Clay Model, Pluto is approximately 4,205 meters from the Sun.

If 4,205 meters represents the distance from Pluto to the Sun, then how many AUs are represented by 4,205 meters? (Hint: Refer to your Planet Data Sheet - Outer Planets on page 7.)

$$
4,205 \text { meters represents } \quad \text { AU. }
$$

This allows us to set up a ratio.

Distance from Pluto to the Sun in the scale model $=$Distance from Pluto to the Sun in the solar system

The relationship between $\qquad$ m and AU will be our scaling ratio. We can use this relationship to find the distances from all of the planets to the Sun in the model.

Begin with the information you know:

1. What is the distance between the Earth and the Sun? $\qquad$
2. The scaling ratio for this model is:

Next, to find the scale of the model, we want to know how many meters represent 1 AU?

Step 1: Set up a ratio of the distance from a planet to the Sun in the model and the distance from a planet to the Sun in the solar system. Write an " $x$ " in the gray space below to represent the number we do not know.

$$
\frac{\text { Distance from Earth to the Sun in scale model }}{\text { Distance from Earth to the Sun in solar system }}=\frac{\mathrm{m}}{1 \mathrm{AU}}
$$

Step 2: Set this ratio equal to the scaling ratio.

| $\frac{\text { Distance from Pluto to Sun in model }}{\text { Dist. from Pluto to Sun in solar system }}$ | $=\frac{\text { Distance from Earth to Sun in model }}{\text { Dist. from Earth to Sun in solar system }}$ |
| ---: | :--- |
| $\frac{\mathrm{m}}{\mathrm{AU}}$ | $=\frac{\mathrm{x}}{\mathrm{AU}}$ |

Step 3: Solve the problem using the same steps in the sample problem on page 14 .

$$
\frac{4,205 \mathrm{~m}}{39.3 \mathrm{AU}}=\frac{\mathrm{x}}{1 \mathrm{AU}}
$$

Cross multiply.
$\square$ $\mathrm{m} \cdot 1 \mathrm{AU}=\mathrm{x} \cdot$ AU

Divide both sides by 39.3 and cancel the AUs.

Rewrite the problem as a single ratio.

Divide the numerator by the denominator. Round to a whole number.

State the answer.

$$
1 \mathrm{AU}=\square \mathrm{m}
$$

Or the distance from Earth to the Sun in the model is $\qquad$ meters.

## Congratulations!

Now that you know how many meters represent 1AU, you have successfully calculated the scale of the Clay Model.

Name: $\qquad$ Date: $\qquad$

## Calculating Scale of the Clay Model, Part II

Based on the scale diameter of the clay planets, it has been determined that the scale distance of the clay model of the solar system is $\qquad$ meters. This represents 1 AU in our solar system. Use this information to:

- Calculate how many meters ( $m$ ) each planet is from the Sun. (column A) Round your answers to the nearest whole meter.
- Convert the meters to half-meter paces. (column B)
- Calculate the number of paces that are between each object. (column C)

## Creating a 1000-Meter Model of the Solar System

Collect and label the 10 objects below. If certain items cannot be found, then items of similar size may be substituted. (The pictures below are not to scale.)

| Body | Scale Model Object | Scale Model Size |
| :---: | :---: | :---: |
| Sun | bowling ball | 235 mm |
| Mercury | regular pin head | 0.8 mm |
| Venus | green peppercorn | 2.0 mm |
| Earth | black peppercorn | 2.1 mm |
| Mars | regular pin head | 1.1 mm |
| Jupiter | pecan | 24.1 mm |
| Saturn | hazelnut | 20.4 mm |
| Uranus | coffee bean | 8.6 mm |
| Neptune | coffee bean | 8.4 mm |
| Pluto | small pin head | 0.4 mm |

$\qquad$

## Calculating Scale of the $\mathbf{1 0 0 0 - M e t e r ~ M o d e l , ~ P a r t ~ I ~}$

## Purpose

Now that you have created a scale model of the solar system in terms of size, you need to establish a scale for your model in terms of distance. Then you will need to calculate the distance from the Sun for each planet in your model.

Finding the scale between the model of the solar system and the actual solar system is the mathematical challenge of this activity. For a model, the "scale" is the amount by which the size of the original has been changed proportionally. The key to finding the scale distances is using ratios and proportions-relationships between the model distances and the actual distances.

## Let's Begin!

In your 1000-meter model, Pluto is the furthest object from the Sun. For the $1,000-$ Meter Model, Pluto (small pin head) is approximately 1,000 meters from the Sun (bowling ball).

If 1,000 meters represents the distance from Pluto to the Sun, then how many AUs are represented by 1,000 meters? (Hint: Refer to your Planet Data Sheet - Outer Planets on page 7.)

1,000 meters represents ___ AU.

This allows us to set up a ratio.
$\frac{\text { Distance from Pluto to the Sun in the scale model }}{\text { Distance from Pluto to the Sun in the solar system }}=\frac{\mathrm{m}}{\mathrm{AU}}$

The relationship between $\qquad$ m and AU will be our scaling ratio. We can use this relationship to find the distances from all of the planets to the Sun in the model.

Begin with the information you know:

1. What is the distance between the Earth and the Sun? $\qquad$
2. The scaling ratio for this model is:

Next, to find the scale of the model, we want to know how many meters represent 1 AU?

Step 1: Set up a ratio of the distance from a planet to the Sun in the model and the distance from a planet to the Sun in the solar system. Write an " $x$ " in the gray space below to represent the number we do not know.

$$
\frac{\text { Distance from Earth to the Sun in scale model }}{\text { Distance from Earth to the Sun in solar system }}=\frac{\mathrm{m}}{1 \mathrm{AU}}
$$

Step 2: Set this ratio equal to the scaling ratio.

| $\frac{\text { Distance from Pluto to Sun in model }}{\text { Dist. from Pluto to Sun in solar system }}$ | $=\frac{\text { Distance from Earth to Sun in model }}{\text { Dist. from Earth to Sun in solar system }}$ |
| ---: | :--- |
| $\frac{\mathrm{m}}{\mathrm{AU}}$ | $=\frac{\mathrm{x}}{\mathrm{AU}}$ |

Step 3: Solve the problem using the same steps in the sample problem on page 14 .

$$
\frac{1,000 \mathrm{~m}}{39.3 \mathrm{AU}}=\frac{\mathrm{x}}{1 \mathrm{AU}}
$$

Cross multiply.
$\square$ AU

Divide both sides by 39.3 and cancel the AUs.

Rewrite the problem as a single ratio.

$$
\underline{m}=x
$$

Divide the numerator by the denominator. Round to one decimal point.

State the answer.

$$
1 \mathrm{AU}=\square \mathrm{m}
$$

In the model, the distance from Earth to the Sun is $\qquad$ meters.

## Congratulations!

Now that you know how many meters represent 1AU, you have successfully calculated the scale of the 1000-Meter Model.

Name: $\qquad$ Date: $\qquad$

## Calculating Scale of the 1000 -Meter Model, Part II

Based on the scale diameter of the model planets, it has been determined that the scale distance of the 1,000-meter model of the solar system is meters. This represents 1 AU in our solar system. Use this information to:

- Calculate how many meters ( $m$ ) each planet is from the Sun. (column A) Round your answers to the nearest whole meter.
- Convert the meters to half-meter paces. (column B)
- Calculate the number of paces that are between each object. (column C)

| Object |  | $\begin{array}{c}\text { Actual } \\ \text { Diameter } \\ (\mathrm{km})\end{array}$ | $\begin{array}{c}\text { Scale } \\ \text { Diameter } \\ (\mathrm{mm})\end{array}$ | Model Object | $\begin{array}{c}\text { Distance } \\ \text { from } \\ \text { Sun } \\ (\mathrm{AU})\end{array}$ | $\begin{array}{c}\text { Scale } \\ \text { Distance } \\ (\mathrm{m})\end{array}$ | $\begin{array}{c}\text { \# of 1/2 } \\ \text { Meter } \\ \text { Paces } \\ \text { from } \\ \text { Sun }\end{array}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Sun | $1,391,900$ | $\mathbf{2 3 5}$ | bowling ball | - | - | - | - |
| froves |  |  |  |  |  |  |  |
| Object |  |  |  |  |  |  |  |$]$

$\qquad$ Date: $\qquad$

## Think About It!

You just created a model of the solar system that is to scale for both size and distance. Reflect on what you noticed and learned.

7. Based on your scale model, to which of the planets do you think we should send humans? Why?
8. To which of the planets do you think we should not send humans? Why not?

Name: $\qquad$ Date: $\qquad$

## Graphing Resource

## Student Guide

## Types of Graphs

There are several types of graphs that scientists and mathematicians use to analyze sets of numbers or data.

Bar graphs are often used to compare values.

Pie graphs are often used to compare percentages or parts of a whole.

Line graphs are often used to show rates of change.

## Before You Begin

When you are planning to graph data, you need to answer some questions before you begin.

1. What type of graph will you use?
2. What unit of measurement will you use?
3. What scale will you use?
4. What will be the minimum and maximum values on your graph?
5. Will your graph start at 0 ?

## Making Bar Graphs and Line Graphs

Every graph needs a title and labels on the horizontal "x" axis (side-toside) and the vertical " $y$ " axis (up and down).

The unit of measurement you are using needs to be clearly shown (inches, kilograms, etc.). The unit for the bar graph above is "number of books" as is written in the vertical y-axis label.

You also must choose a scale for your vertical y-axis. The vertical scale on the bar graph above goes from 0 to 80 in increments of 10.

The scale is determined by the data you are graphing. To determine the scale, look at the largest and smallest numbers you will be graphing.
For this line graph, the

## Making a Pie Graph

A pie graph is shown using a circle, which has 360 degrees. To make an accurate pie graph you will need a compass or a similar instrument to trace a circle and a protractor to measure angles in degrees.

Start by making a circle. You will then have to multiply your fractions or percents (in decimal format) by 360 degrees to find out how many degrees you will need in each wedge. For example:

| Color | \% of class that likes the color |  |  |
| :--- | :---: | :---: | :---: |
| Blue | $45 \%$ |  |  |
| Green | $25 \%$ |  |  |
| Red | $20 \%$ |  |  |
| Pink | $10 \%$ |  |  |
|  |  |  | $100 \%$ |

The sum of your fractions should total to $100 \%$ !

To find out how many degrees of the pie graph will represent the number of students in the class who like the color blue, you would multiply 360 degrees by 0.45 . The result of your calculation is 162 degrees. To find out how many degrees of the pie graph will represent the number of students in the class who like the color green, you would multiply 360 degrees by 0.25 . The result of your calculation is 90 degrees.

To mark off the blue portion of the pie graph, start by drawing a radius of the circle (a line segment from the center of the circle to the circle itself). Then use the protractor to measure an angle of 162 degrees and draw the corresponding radius. The green portion will have an angle measure of 90 degrees, the red portion will have an angle measure of 72 degrees, and the pink portion will have an angle measure of 36 degrees. The sum of these angles will have an angle measure of 360 degrees, the number of degrees in a circle.

| Pink $=36{ }^{\circ}$ | \% of Class That Likes the Color |
| :---: | :---: |
| Blue $=162^{\circ}$ |   <br> Red Pink <br> $10 \%$ |
| Green $=90^{\circ}$ | - |
| $\underline{\text { Red }}=72^{\circ}$ |  |
| Total $=360^{\circ}$ |  |

When the portions have been drawn into the circle, you then need to color each portion, label each portion with both the category and the percent or fraction, and give the graph an overall title.

Name: $\qquad$ Date: $\qquad$

## Graphing Distances in the Solar System

You are going to graph the distances from the planets to the Sun based on the data you have collected. First you need to plan your graph by answering the five questions below. Then you should create your graph on graph paper or chart paper. Be sure to give your graph a title and to label your x - and y -axis.

1. What type of graph will you use? $\qquad$

2. What unit of measurement will you use? $\qquad$
3. What scale will you use? $\qquad$ to $\qquad$ in increments of $\qquad$
4. What will be the maximum and minimum data values on your graph?

Maximum value $=$ $\qquad$

Minimum value $=$ $\qquad$
5. Will your graph start at 0 ? If not, with what number will your graph begin?

|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## So What Do You Think?

Now that you have collected data on the planets, built a scale model of the solar system, and graphed the distances of the planets from the Sun, take a moment to think about what you have learned.

1. What did you learn from What's the Difference, the scale model, and your graph?
2. Based on the scale model and what you have learned, to which planet or moon do you think we should send humans in our solar system? Why?
$\qquad$
3. What else do you need to know about the planets and moons in order to make a recommendation?

Name: $\qquad$ Date: $\qquad$

## Lesson 1 Extension Problems

## Bode's Law

The chart below shows the distance from each planet and the asteroid belt to the Sun rounded to the nearest tenth of an Astronomical Unit.

| Mercury | Venus | Earth | Mars | Asteroids | Jupiter | Saturn | Uranus | Neptune | Pluto |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0.4 | 0.7 | 1.0 | $\approx 1.6$ | $\approx 2.8$ | 5.2 | $\approx 10.0$ | $\approx 19.6$ | $\approx 30.1$ | $\approx 39.6$ |

Can you find a pattern between the distance from one planet to the Sun and the next planet to the Sun?

For example:

> Distance from Venus to the Sun - Distance from Mercury to the Sun = ?

$$
0.7-0.4=0.3
$$

Use the chart below to solve this equation for each of the planets. The first one has been done for you.

| Mercury | Venus | Earth | Mars | Asteroids | Jupiter | Saturn | Uranus | Neptune | Pluto |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0.4 | 0.7 | 1.0 | 1.6 | 2.8 | 5.2 | 10.0 | 19.6 | 30.1 | 39.6 |

What is the pattern for the distance between the planets? Describe the pattern that you see.

In reality, the pattern is more complex than presented here. The original pattern can be described as follows:

- List the numbers, doubling every number after 3. ( $0,3,6,12$, etc.)
- Add 4 to each number.
- Divide each of the resulting numbers by 10 . The results are the approximate distances of the planets from the Sun, measured in AU.

## Background

Bode's Law is not really a law; it's merely an interesting relationship between the arrangement of the planets around the Sun. In fact, it is based on rough estimates of planetary distances (at least as good as the measurements could be in the 1700s), so the actual orbital distances that you calculated in other parts of this lesson will be somewhat different than the values listed here.

This relationship was first discovered by Johann Titius and published by Johann Bode in 1772, hence why it is called Bode's Law. It was calculated before Uranus, Neptune, and Pluto were discovered. Astronomers actually found Uranus because they searched the sky at the distance predicted by this relationship! This pattern was also discovered before astronomers knew about the asteroid belt. Many scientists think that the asteroid belt is the remains of a destroyed planet, whose distance would have fit in perfectly with this pattern.

## Lesson 1 Extension Problems continued...

## Ratio Problems and Conversion Problems

The following are problems that will take multiple steps to solve. You will need to measure lengths inside the classroom and apply what you know about scale, ratio, and proportion to solve them. You may choose the units you work with as long as they are appropriate. Be sure to include descriptions and pictures to explain how you solved the problem.

## 1. Scale Movie Stars

Some fantasy characters, such as Hobbits from Lord of the Rings or Hagrid from the Harry Potter series are on different scales than humans. The following calculations will demonstrate how a regular object would need to be changed to fit the scale size of a character.

Hobbits are known as Halflings. They are about half the size of a human. Hagrid, however, had a Giantess mother. He is about twice the size of a
 human.

A. If your teacher became a Hobbit, estimate how tall he or she would be. Next estimate how tall your teacher would be if he or she were Hagrid's size. Measure your teacher and calculate his or her Hobbit and Hagrid heights. If possible, mark the Hobbit height, Hagrid height, and actual height of your teacher on the wall or chart paper.
B. Choose an object in the classroom. Estimate the height or length that object would be if it were scaled to Hobbit or Hagrid size. Measure the object and calculate exactly how long or tall it would be for a Hobbit-sized or Hagrid-sized teacher. Draw a scale picture of how that object would look. How close was your estimate?

Example: A standard stapler is 16 cm long and 5 cm high. A Hobbit-sized stapler would be 8 cm long and 2.5 cm high. A Hagrid-sized stapler would be 32 cm long and 10 cm high. Your picture would need to MATCH the new sizes. Remember to label the sizes on your picture.

## 2. Scale Model Athletes

In order to appear realistic, action figures and dolls are made to scale. If all athlete models are the same height, are they all on the same scale?
A. An average sports action figure is about 20 cm tall. Calculate the ratio of this toy's height to the height of your favorite athlete. (Hint: You will need to look up some information on your favorite athlete to solve this problem!)
B. Imagine that you dressed up as your favorite athlete for Halloween. Calculate the ratio between your height and the actual athlete's height. (Hint: You'll need to measure yourself for this one!)
C. Pretend you are making a scale model in clay of your favorite athlete. For your model, 1 cm will represent 15 cm of the height of your athlete. How many cm tall will your scale model be? (Hint: Round your answer to the nearest cm.)

## 3. How Far is an AU?

Astronomical units make measuring distance in our solar system easier. How LARGE is an AU in relation to distances here on Earth?
A. One AU is $150,000,000 \mathrm{~km}$. The distance from New York to Los Angeles is $4,548 \mathrm{~km}$. Estimate how many times you would have to travel from New York to Los Angeles to travel one AU. Calculate the actual number of trips and round down to the nearest whole number.
B. Imagine you had a jump rope that was the length of 1 AU. Estimate how many times you could wrap your jump rope around the equator of the Earth. Calculate the actual number of times your jump rope could wrap around the equator and round that value to the nearest whole number.

## 4. A Desk-Sized Model

As you have seen, making a scale model of the solar system is challenging. What would the model look like on different scales?
A. If you wanted to fit a model of the solar system on your desk, what would be the distance from the Earth to the Sun in the model? (Hint: You will need to measure your desk.)

Estimate how big Jupiter would be in this scale model, and then calculate the actual size.

Do you think a model of this size would be helpful? Why or why not?
B. Estimate the distance from the Earth to the Sun in a model that would fit inside your classroom. (Hint: You will need to measure your classroom.)

Calculate the distance from Earth to the Sun in the model.

Estimate how big a model of Jupiter would be in this model and then calculate the actual size.

Would this model be better than the one that would fit on your desk? Why or why not?

## AFUs (Absolutely Fabulous Units)

Scientists created an Astronomical Unit (AU) to measure distance in our solar system. Create your own system of measurement. Choose any distance you wish (except, of course, the distance between the Earth and Sun-that one's already taken!).

## EXAMPLE

## Name: $\quad$ Astronomical Unit

Definition: An astronomical unit is the distance between the Earth and Sun.

Size: $\quad$ One astronomical unit $=150,000,000$ kilometers

Mercury: $\underline{0.4} \mathrm{AU} \quad$ Mars: 1.5 AU Uranus: 19.2AU
Venus: $\underline{0.7 \mathrm{AU}}$ Jupiter: $\underline{5.2 \mathrm{AU}}$ Neptune: $\underline{30.0 \mathrm{AU}}$
Earth: 1.0 AU
Saturn: 9.5 AU Pluto: 39.3 AU

1. Name your unit: $\qquad$
2. Define it: $\qquad$

Tell its size: $\qquad$ $=$ $\qquad$
3. Convert all of the distances in the solar system to your new unit.
Mercury:

Venus: $\qquad$
Earth: $\qquad$ _

Mars: $\qquad$
Jupiter: $\qquad$
Saturn: $\qquad$

Uranus: $\qquad$
Neptune: $\qquad$
Pluto: $\qquad$

## Think About It / Write About It / Discuss It Questions

1. If you made a model of our solar system that would fit on your desk to scale for both distance and size, what would you expect the planets to look like?

Inner:

Outer:

Why would this be a difficult model to build?
$\qquad$
$\qquad$
2. Estimate how long you think it would take to travel to Pluto. $\qquad$

What would you do during that time period?
3. Why do you think NASA is interested in learning how to build faster or more fuelefficient spacecraft?
