

# Artificial intelligence

Already in 2018 there is software that learns from experience by itself.

A software was taught how to play the game Go. The software has been getting better and better by playing many games.

After that training the software could beat the best human Go player.

In 2018 there is software that understands texts. Responses are then automatically created by the software. This technique could eliminate thousands of administrative jobs.

What opportunities are there with artificial intelligence? What is not there today? What will be possible until 2030? How will artificial intelligence change our life?
