

# Peer learning

Relating means dealing with other ideas and thoughts.

School, a source of ideas and learning, was the place where I made my first friends, where I learned to grow morally and help those who needed it most.

A constructive experience was that proposed by our Maths teacher, which involved some of my classmates including Pierluigi and Matteo. This project consisted in mutual help, in facing with everyday concerns among classmates and learning together. Especially in the classroom during Maths lessons it was proposed a different arrangement of desks in order to help children who had difficulties in specific subjects. Every other day one of my classmate, Alessia, and I were sitting near Pierluigi and Matteo, my best friends, with whom I have been friend since the first days of school.

Our task was to help them to improve their learning method and knowledges. This experience was very formative both for Pierluigi and Matteo and for me, in fact I learned the true meaning of exchanging ideas, friendship and having fun together while studying. The objective was also to build a new method of learning efficacious to improve both who helped and who was helped. Apart from lesson hours we had the opportunity to meet in the afternoon at school and home, where we get ready for oral tests. Thanks to these days I learned to know better other boys in the class that through the project have become more sociable, and open to other people's opinions.

At the end of this project we achieved our results: some of my classmates have improved significantly and teachers have registered the improvement such as real better marks, and as a consequence they congratulated with all of us. This experience has also given rise to new friends, and new relationships thanks to which we get on better with others. This project has been unique and difficult to forget.
