# INTERNET SAFETY

▶ Every serious system today discusses the security challenges of the application of modern information technologies: legal dilemmas, ethical issues and risks of reliability. As with the use of weapons, people use computers to support their work, but very often to break the law.

► Another type of computer crime is sabotage of hardware or software.

► Malware protection is one big branch of the IT industry, and certainly one of the most significant. Lately, it is really not easy to protect the system, and especially Windows-based operating systems, from attacks that "lurk at every turn". In order to successfully protect the user from viruses and worms, a certain level of knowledge and discipline in the use of computers is needed, which in the case of spies and Trojans is often never enough.

► A firewall can help prevent hackers or malicious software (such as worms) from accessing your computer over a network or the Internet. It can also help prevent computers from sending malware to other computers.

The goal is to protect children from inappropriate content, the negative effects of using the Internet and to raise the level of awareness and knowledge about how virtual reality affects children and how far they are allowed to enter the digital world, without being safe and without consequences.
