

# Internet safety

There is 4 rules to use internet

1. Never leave personal information to people you dont know
2. Dont send pictures to strangers
3. Dont give your password
4. Dont make appointments

- The internet is huge place . You might think that it doesn't matter whether you stop at Starbucks, McDonald's, or a local coffee shop to catch up on social media. Just remember that public networks aren't safe unless you take necessary precautions.

- When you use public internet, it's likely that the sites you visit will be stored somewhere. It's possible this data is used for marketing analysis. They want to know your preferences to better advertise to customers. However, the worst-case scenario is when someone uses this data to get private information about you.

- You usually have to register when connecting to a public hotspot, confirming you agree to terms and conditions through a text or email. This is yet another way to collect information. And by providing this info, you automatically agree to terms, which, let's be honest, you haven't read.

## Dark web

The dark web is a part of the internet that isn't indexed by search engines. You've no doubt heard talk of the “dark web” as a hotbed of criminal activity — and it is. Researchers Daniel Moore and Thomas Rid of King's College in London classified the contents of 2,723 live dark web sites over a five-week period in 2015 and found that 57% host illicit material.
