

Environmental issues in reunion island

Grondin
Etienne

Like everyone, we are confront to a lot of environmental issues in reunion Island. In fact, these issues are increasingly reported by local media.

_So, In the island we notice a drought like the one in November 2020, which has had impact on the agriculture because there is a scarce of water . To combat this problem, the prefect has introduced restrictions such as the ban on washing your car. We also noticed that the drought was drying up the basins of the island. Obviously the drought is due to climate change wich is accompained of a rising of the temparature.

_Moreover, We face the death of our coral reef, because of Coral bleaching. In fact,Coral bleaching is a wasting phenomenon caused by rising water temperature. It drives out the symbiotic algae that give coral its color and nutrients. Reefs can recover if the water cools, but they can also die if the phenomenon persists. And Without corals, the environments in which they find themselves would no longer exist, as would all the life they harbor.Like the drought it is due to the climate change

In addition, Reunion Island also faces the pollution brought by tourism as well as poor waste management.
