

DeGree-Robot

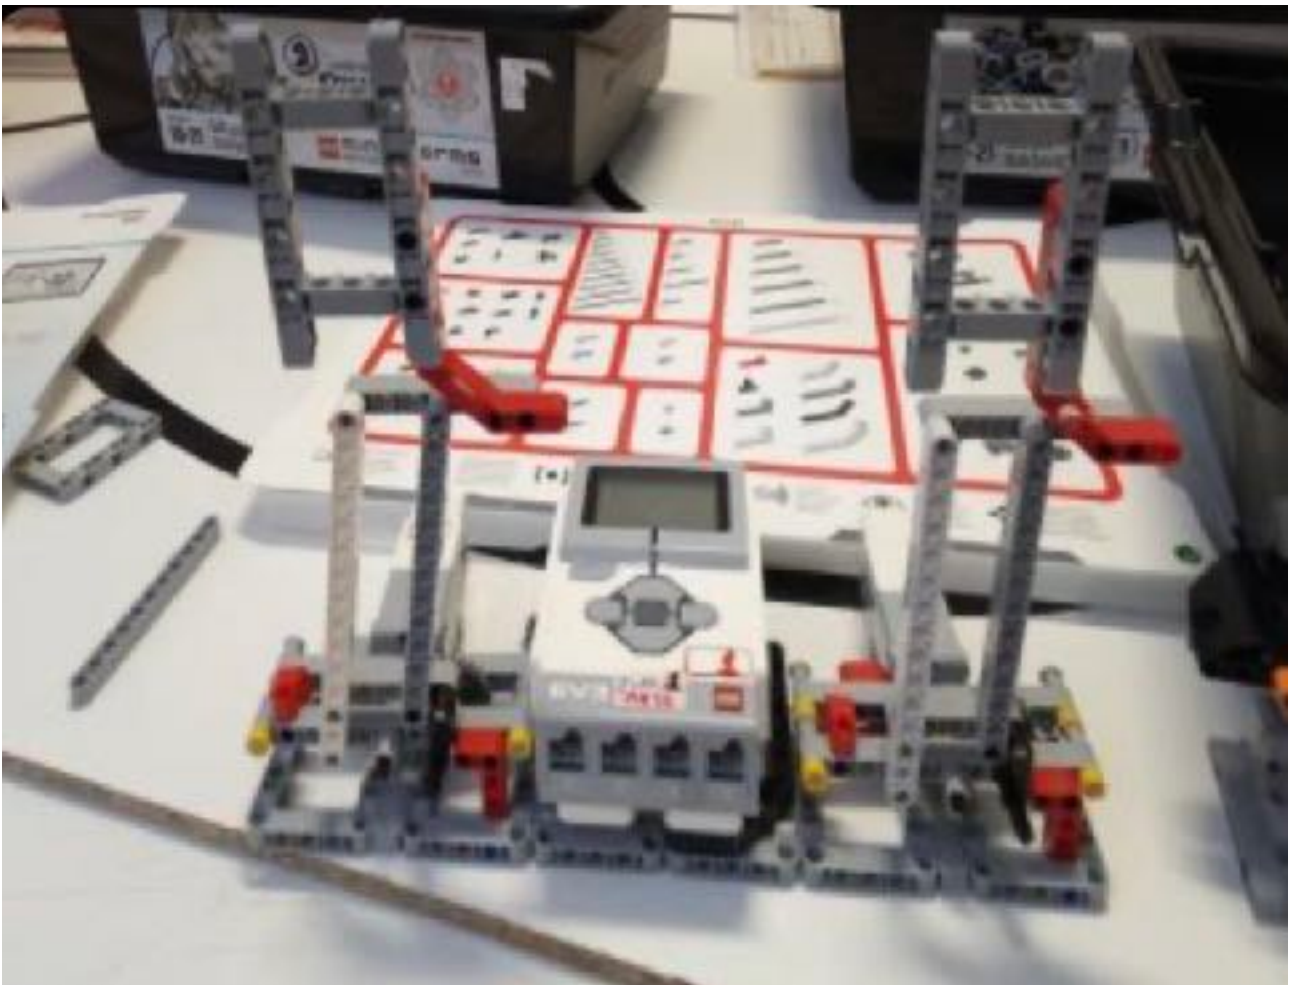

Our rooter should be able to move his arms with some push-motors so it can tell a shadow story. Mario has already built his robot and it looks really good!

The robot needs some LargeRegulated Motors so it can drive forwards and backwards. A Touch Sensor should also be installed to activate and stop the robot.

We also have to use some push motors, so the robot can move his arms two/three dimensional.

We have already created some packages and classes in Eclipse for our robot, but we still have to discuss what our robot wants to express in our shadow story.

My greek partner Mario and I are planning a cool story for our telling book shadow-story. I've got several ideas, for example something inspired by the greek mythology, or it could dance some traditional dances or other typical cultural themes.

First robot built by Mario
