

NABCH

Our enterprise its focus on put down the pollution and everything it entails, millions of diseases, environmental damage... More than 7000 people in Spain, not get just to a disease, they die due to it. And everything because we don't want to give the problem the importance that it really have. This problem concern to all of us, so that, our enterprise is aimed to all kind of public. Since children who needs to know how important is not to pollute, to those of more advanced age. Furthermore, this is the most comfortable and easier way to contribute to the planet for all.

For that, we must achieve that all the buildings have a basement of litter in the most near future as we can. Litters that will be correctly sorted for recycling and connected with the houses by a tube. With this tube, you will just have to press the kind of litter you want to cast aside and the machine will make the rest of the job (open the channel it will carry the litter to his respective trash can). This design will be totally sustainable if it would be approved, because it will be saved the bad smell generated in the streets and what involve have the residues outdoors. Also it will solve the actual problem in Spain between the company of litter and the state that make untenable the situation and we would offer to the workers work directly in our company. Also we will obtain with it a series of concrete benefits: avoid the contamination, reduction of the unemployment, contribute to save the planet.

It also help to reduce the million of diseases produced by the pollution and in that way, we help to improve residents health, something that nowadays any enterprise has done anything for, as a result, our enterprise is a innovative proposal.

For us, our clients are the most important and we have made this enterprise for them. To improve their life and to ensure a prosperous life for all the future inhabitants of our planet, that will die if we don't do anything to stop it before 30 years. Our planet will be destroy because of the extinction of animals, the water contamination and finally with the totally destroy of the ozone layer.

I don't want be part of it, and I'm sure that you don't want neither. Change now or we will die forever.
