

The Call for Action

Today I will talk about global warming and how this issue is affecting us today. Global warming is the long-term heating of earth's climate system due to human activities. There's no doubt that our planet is warming up and we are the ones who can keep the climate disaster further away. Global warming occurs as a result of devastating factors that negatively affect the climate. There are many solutions and things that can be done to prevent this situation from getting even worse. Each and every living organism has been negatively affected by the current situation.

Global warming is a very big issue in today's society. It has also affected our planet in many ways, for example higher temperatures are worsening many types of disasters, including storms, heat waves, floods, and droughts. Not only does this affect the planet, but it also affects us, today's scientists point to climate change as the biggest global health threat of the 21st century, as temperatures spike, so does the incidence of illness and death. As humans, we face a lot of challenges, but we're certainly not the only ones catching heat. As land and sea undergo rapid changes, the animals that inhabit them are doomed to disappear if they don't adapt quickly enough. Some will make it, and some won't.

These actions have been noticed and actions are being made: more and more people try to reduce the use of cars and use the possibility to walk or use public transport. Recycling has also become more important in today's society. It is getting easier to do, because many materials can be recycled and used repeatedly. Thrift and second-hand stores are also getting popular. People have started to realize the dangers of global warming and are trying to contribute to make the situation better. Furthermore, everyone is encouraging each other to go zero-waste, because we all know that waste takes a long time to decompose on its own and by burning it we are creating more carbon dioxide emissions.

Another significant reason for climate change are factories, different industries and corporations that are contributing huge amounts of green gases by making products and burning fossil fuels. This is when deforestation starts, which is bad in many circumstances. For example, people call trees the lungs of our planet, because they filtrate the air and turn carbon dioxide into oxygen, this means cutting down forests is leading to reducing the areas that create that oxygen. Not only does deforestation affect us humans, but it also contributes to the extinction of many animal species by destroying their natural habitats.

In conclusion, we all know that global warming and climate change is a very big problem in our life. If actions were taken earlier, we could have prevented it before getting this big, but all we can do now is to try as hard as we can to keep it from getting worse.
