

## **Atmospheric pollution in my town**

Atmospheric pollution is the appearance of pollutant in the atmosphere. There is a variety of pollutant such a noise , radiation, carbon dioxide and more. In my town Heraclion we have some problems with atmospheric pollution who responsible is the human activity.

There are a lot of problems of pollution. First of all the transport, people must start using public transport and reduce their moving with their cars or motorcycles. Secondly the industries must have filters in their chimneys in order not to damage the air. In addition during the winter a lot of houses are using sources of heating, such as radiator, space heater, and foreplace. The smoke that their chimney take out contain an enormous amount of carbon dioxide that is very harmful for our health and our environment. Last but not least forest fires are anothee important problem because a lot of harmful dioxides liberate in the environment and a lot of trees are destroyed.. But the most important in this issue is that a lot of dioxides are in the air and we have less fresh air to breathe.

Our community has taken some measures and i think the atmospheric problem will be solved in some years
