

Students comments on the exhibition "Save the world..."

Laura (12) from Germany

I thought it was very nice that we were welcomed in different languages. It was a clear exhibition. A lot of it was new to me. I will now be more aware of my water consumption and waste avoidance.

Johanna (15) from Iceland

I liked the exhibition – it was beautiful. I've never thought about how many trees have to be cut down for our daily needs. I was amazed about the amount of rubbish people produce every year by just using single-use coffee cups for example. I will try to buy less products in plastic and think more about recycling as my dad works on that anyway.

Diego (16) and Ivan (16) from Spain

It was a surprise for us to experience that there is a thing called "virtual water". It is crazy to see how much water is needed to produce small thing. More than 100l of water are necessary just to get a single tomato! And there are countries who do not have enough drinking water for the population. How can they then grow their food? We think we will be more conscious about eating food with a huge process of producing. In the future bionic engineers will have to find a solution to get more efficiency by the consumption of water. I think I will try to buy my drinks in glass bottles instead of plastic and look for items in carton boxes instead of using plastic.

Karol (13) from Poland

The most interesting thing for me here was the amount of water which is needed to produce T-Shirts, cars or phones.

I will try not to waste water and I will talk to my family that we have to recycle our rubbish because of the climate warming.
