
Measurement of gravity acceleration using video analysis

We made a video of freefall stone.

Measurement of the first group

Authors : Pavla Mitrengová, Tereza Janešíková, Lucie Jurášková

We analyzed the video in program Logger Pro.

We approximated measured points with a parabola.

$$s = \frac{g \cdot t^2}{2}$$

$$y = At^2 + Bt + C$$

$$A \approx \frac{g}{2} \rightarrow g = 2A$$

$$A = 5,74 \pm 0,07 \rightarrow g = (11,48 \pm 0,14) m \cdot s^{-2}$$

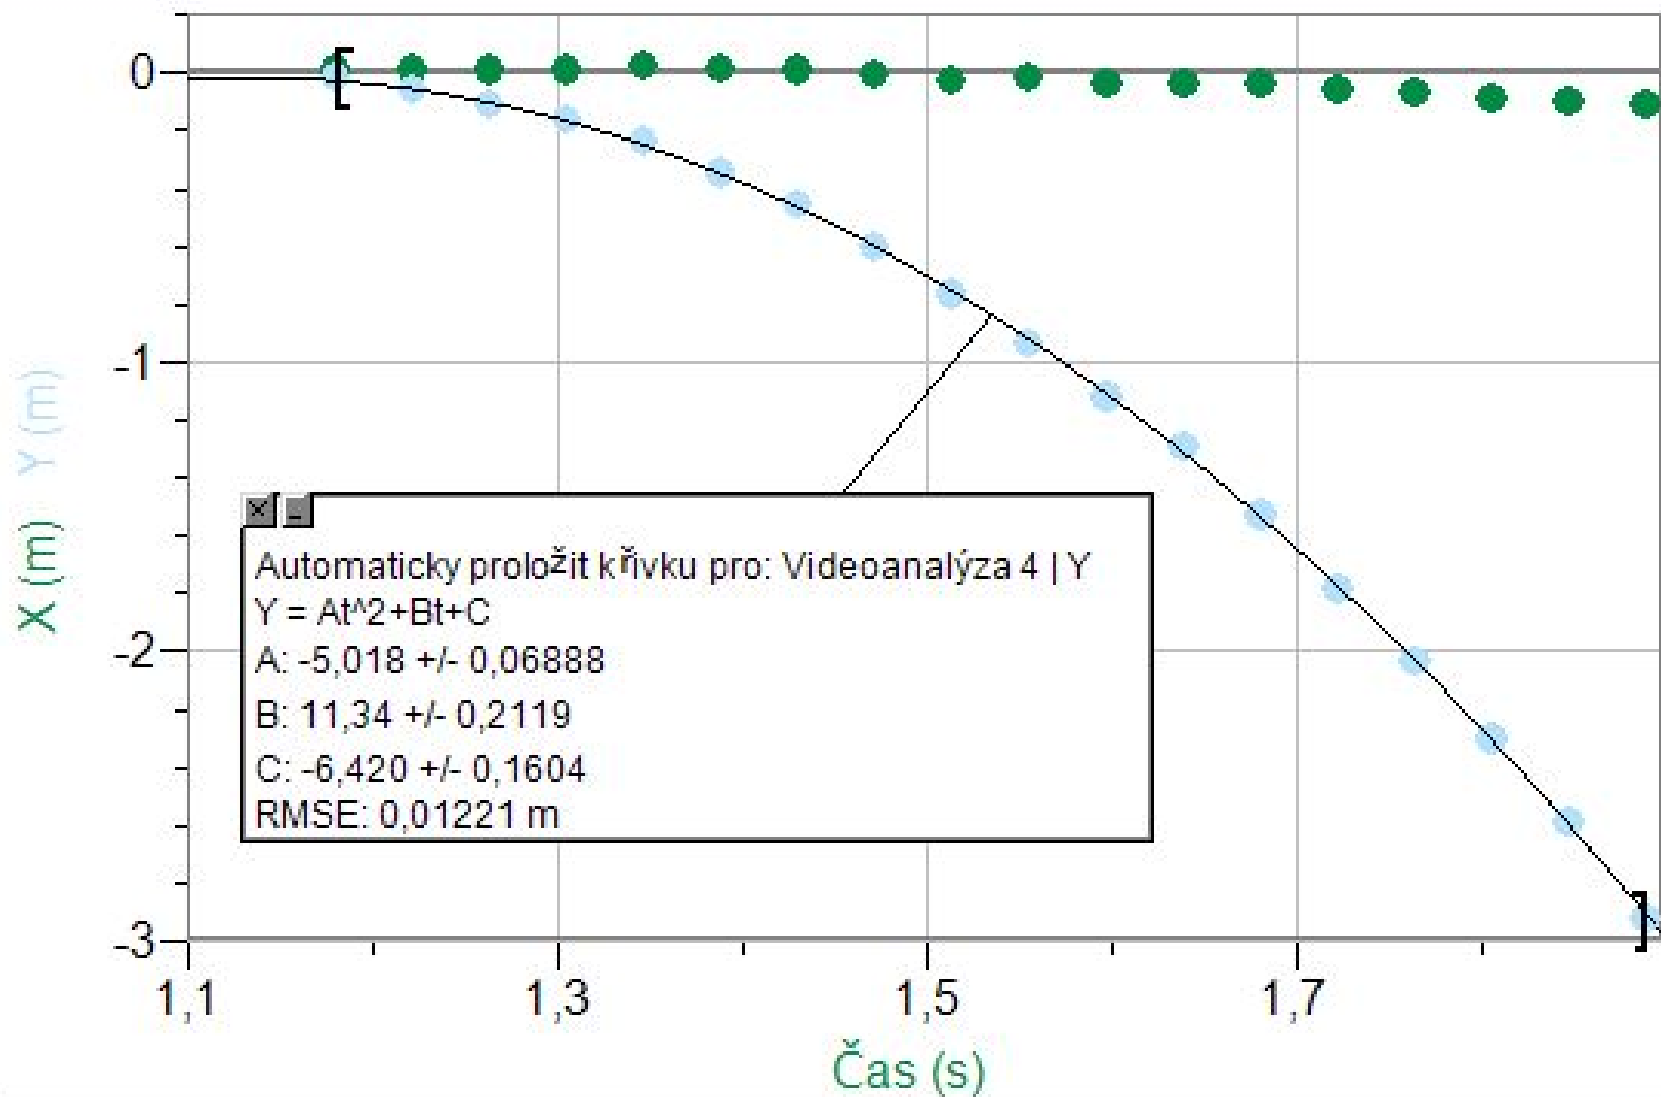

$$g = (11,48 \pm 0,14) m \cdot s^{-2}$$

The measurement was inaccurate because we had a small video resolution.

Measurement of the second group

Authors: Oliver Klus, Kristián Kryška , Jan Horký, Marek Klembara

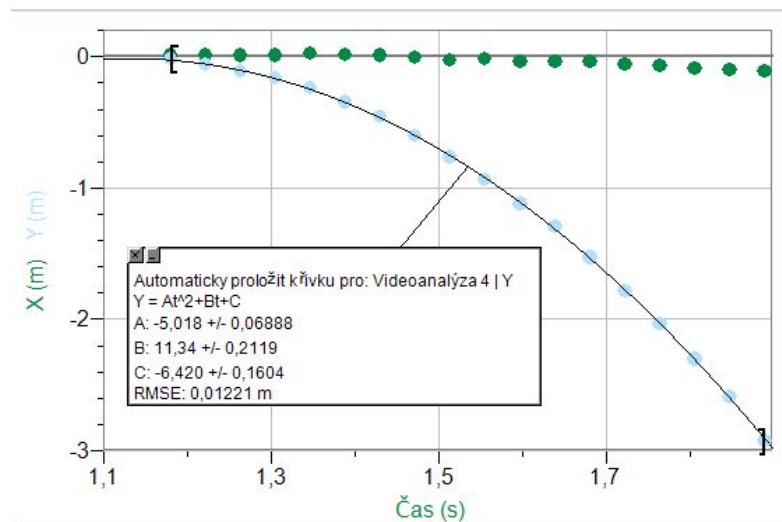

$$s = \frac{g \cdot t^2}{2}$$

$$y = At^2 + Bt + C$$

$$A \approx \frac{g}{2} \rightarrow g = 2A$$

$$A = 5,018 \pm 0,068 \rightarrow g = (10,04 \pm 0,14) \text{ m} \cdot \text{s}^{-2}$$

$$g = (10,04 \pm 0,14) m \cdot s^{-2}$$
