Let's go for a ride! The physics of roller-coasters

Creating a scale model and performing measurements on the model

Given:

$$m = 24,02 \text{ g}$$

$$Y_{\text{beginning}} = 1,02 \text{ m}$$

$$Y_{\text{top looping}} = 0,55 \text{ m}$$

$$Y_{\text{bottom looping}} = 0,20 \text{ m}$$

$$R_{\text{looping}} = 0,35 \text{ m}$$

Ghraps

$y(x)$

$x(t)$

$y(t) \rightarrow E_{\text{pot}} \text{ (J/kg)}$ (at the beginning, in the middle and at the end)

$$v_x(t) \left. \begin{array}{l} \\ \\ \end{array} \right\} v = \sqrt{v_x^2 + v_y^2}$$

$$v_y(t)$$

→ $E_{kin} (J/kg)$

(at the beginning, in the middle and at the end)

Calculations:

$$V_{\text{beginning}} (t = 0.033) = \sqrt{-0.102^2 + (-5.11 \cdot 10^{-2})^2} = 0.1140842233 \text{ m/s}$$

$$V_{\text{middle}} (t = 0.733) = \sqrt{(-1.612)^2 + (-1.228)^2} = 2.026457007 \text{ m/s}$$

$$V_{\text{end}} (t = 1.533) = \sqrt{(-1.331)^2 + 0^2} = 1.331 \text{ m/s}$$

The velocity increases until the looping, during the looping it decreases.

$$a_x(t)$$

$$a = \sqrt{a_x^2 + a_y^2}$$

$$a_y(t)$$

$$a_{x\text{beginning}} (t = 0.067) = \sqrt{(-2.851)^2 + (-2.851)^2} = 4.031922866 \text{ m/s}^2$$

$$a_{x\text{middle}} (t = 0.733) = \sqrt{(-1.535)^2 + (-1.755)^2} = 2.33157672 \text{ m/s}^2$$

$$a_{x\text{end}} (t = 1.500) = \sqrt{(10.97)^2 + 1.535^2} = 11.07687343 \text{ m/s}^2$$

$$E_{\text{kin}} = (m \cdot v^2) / 2$$

$$E_{\text{kin beginning}} = (24.02 \cdot (0.1140842233)^2) / 2 = 0,1563126722 \text{ J}$$

$$E_{\text{kin middle}} = (24.02 \cdot (2.026457007)^2) / 2 = 49,3194013 \text{ J}$$

$$E_{\text{kin end}} = (24.02 \cdot (1.331)^2) / 2 = 21,27644761 \text{ J}$$

$$E_{\text{pot}} = m \cdot g \cdot h$$

$$E_{\text{pot beginning}} (0.067) = 24.02 \cdot 9.81 \cdot 1.02 = 240,348924 \text{ J}$$

$$E_{\text{pot top looping}} = 24.02 \cdot 9.81 \cdot 0.55 = 129,59991 \text{ J}$$

$$E_{\text{pot bottom looping}} = 24.02 \cdot 9.81 \cdot 0.20 = 47,12724 \text{ J}$$

$$E_{\text{pot middle}} (0.733) = 24.02 \cdot 9.81 \cdot 0.398 = 93,7832076 \text{ J}$$

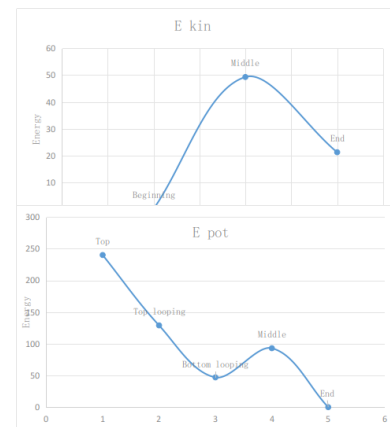

$$E_{\text{pot end}} (1.500) = 24.02 \cdot 9.81 \cdot 0 = 0$$

$$E_{\text{mech}} = E_{\text{kin}} + E_{\text{pot}}$$

$$E_{\text{mech beginning}} = 0.1563126722 + 240,348924 = 240,5052367 \text{ J}$$

$$E_{\text{mech middle}} = 49.3194013 + 93.7832076 = 143,1026089 \text{ J}$$

$$E_{\text{mech end}} = 21,28 + 0 = 21,28 \text{ J}$$

Problems scalemodel:

We needed a heavier ball because it needed to make a looping and our looping was big. With a heavier ball, the potential gravitation energy was bigger and that results in a higher velocity. At first it just fell, but with the heavier ball the problem was solved.

Table with energy

	E_{kin}	E_{pot}	E_{mech}
Beginning	0,16 J	240,35 J	240,51 J
Middle	49,32 J	93,78 J	143,10 J
End	21,28 J	0 J	21,28 J
Average	23,58 J	111,38 J	134,96 J

Mechanic energy change

The mechanic energy decreases because the ball loses energy because there's friction.
