

## The ecological footprint

---

### 1. Introduction

Write in short sentences ...

... what is the “*Personal Ecological Footprint*”?

---

---

... what do you understand in the personal “*Overshoot Day*”?

---

---

### 2. Calculate your own personal ecological footprint.

Use the following webpage to do that: <http://myfootprint.org/en/>

**Note your results** on an extra sheet of paper!

Note the absolute number of hectares and the number of earths we would need, if everybody lives in your lifestyle.

(when you finished the calculator, maybe you must go back one page to see the number of hectares. It is written in a yellow square on top of the page.)

### 3. Ask all students from your country about their footprint and calculate the average footprint of your group and your country.

Me: \_\_\_\_\_ My group: \_\_\_\_\_ My country: \_\_\_\_\_

### 4. Find out the average footprint of your country. You can use one of the following pages:

<https://data.footprintnetwork.org/#/?/>

[https://en.wikipedia.org/wiki/List\\_of\\_countries\\_by\\_ecological\\_footprint](https://en.wikipedia.org/wiki/List_of_countries_by_ecological_footprint)
