A HOUSE EFFICIENT FROM THE ENERGY POSITION

The best time to think about improving the energy efficiency of your home is when you build a new home or renovate the existing one.

When you build a house, the most stressful period is the beginning, in which you have to make a lot of decisions: the surface that the house will have, how it will be divided, how it will be heated, how to ensure the right temperature on summer time, how will we make water? But with gas? But with electricity? What materials will be used? and questions can continue indefinitely.

Careful planning and answers to all these questions can increase your comfort in the new home, but also reduce utilities spending without affecting your living standards.

Important:

Having an energy-efficient home means:

- Save money on electricity and heating;
- Your home will be much more comfortable and suitable for everyday living;
- Last but not least, you will make a major contribution to an extremely important goal:

protecting the environment

- Plan
- Make an energy assessment of the house
- Inform yourself about the legal requirements
- Position the house intelligently
- Choose the house that suits your needs, not wasting wishes
- Pack your home with energy-efficient appliances
- Carefully choose construction materials
